Keys to Soil Taxonomy

Twelfth Edition, 2014

Times Used in Subgroup to
Order Keys

Feature	Count
Paralithic Contact	390
Aquic Conditions	317
Argillic Horizon	259
Volcanic Glass	241
Lithic Contact	231
Andic Soil Properties	201
Slickensides	160
Mollie Epipedon	159
Linear Extensibility	159
Kandic Horizon	158
Duripan	115

Soil v.s. Nonsoil and Soil Depth

“The lower boundary that separates soil from the nonsoil underneath is most difficult to define ... In some instances the more weakly cemented bedrocks ... have been described below the lower boundary of soil and used to differentiate soil series (series control section, defined in chapter 17). This is permissible even though the paralithic materials below a paralithic contact are not considered soil in the true sense.” (Keys to Soil Taxonomy, 12th ed., p. 1)

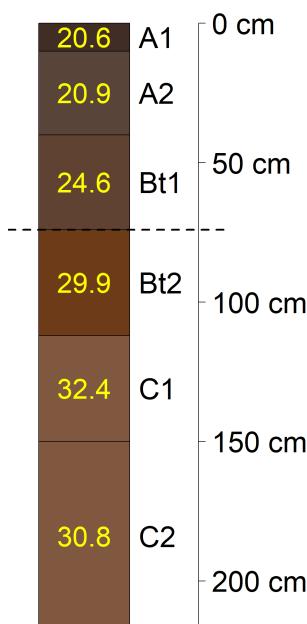

The Argillic Horizon

Cohasset - Fine-loamy, mixed, active, mesic Ultic Haploxeralfs

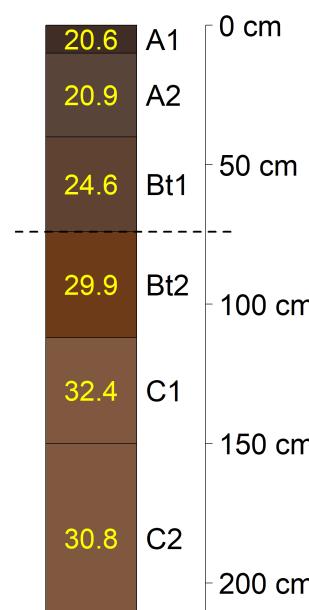

Official Series Description: https://soilseries.sc.egov.usda.gov/OSD_Docs/C/COHASSET.html

The Argillic Horizon

Cohasset - Fine-loamy, mixed, active, mesic Ultic Haploxeralfs

Official Series Description: https://soilseries.sc.egov.usda.gov/OSD_Docs/C/COHASSET.html

Laboratory measured clay content (%), "increase matrix"

		##	20.6	20.9	24.6	29.9	32.4	30.8
	A1	## A1	20.6	.	FALSE	FALSE	FALSE	FALSE
	A2	## A2	20.9	.	FALSE	FALSE	FALSE	FALSE
	Bt1	## Bt1	24.6	.	.	TRUE	FALSE	FALSE
	Bt2	## Bt2	29.9	.	.	.	FALSE	FALSE
		## C1	32.4	FALSE
		## C2	30.8

- A difference in clay content of 0.5% in the **Bt1** horizon shifts the top of the Particle-Size Control Section downward by 34 cm (to the top of the **Bt2**).
- The Argillic Horizon and Particle-Size Control Section start at 74 cm.

The Argillic Horizon

Problems

- *Upper boundary of Argillic Horizon* – tied to Particle-Size Control Section boundary.

The Argillic Horizon

Problems

- *Upper boundary of Argillic Horizon* – tied to Particle-Size Control Section boundary.
- *Bottom of the Argillic Horizon* – depends on (lack of) clay films or other accumulation.

The Argillic Horizon

Problems

- *Upper boundary of Argillic Horizon* – tied to Particle-Size Control Section boundary.
- *Bottom of the Argillic Horizon* – depends on (lack of) clay films or other accumulation.
- *Truncated Argillic Horizons* – depends on a lithologic discontinuity or exposure.

The Argillic Horizon

Problems

- *Upper boundary of Argillic Horizon* – tied to Particle-Size Control Section boundary.
- *Bottom of the Argillic Horizon* – depends on (lack of) clay films or other accumulation.
- *Truncated Argillic Horizons* – depends on a lithologic discontinuity or exposure.
- *"Wimpy" Argillic Horizons* – low total clay content, marginal clay increase, limited development of morphology (e.g. clay films)

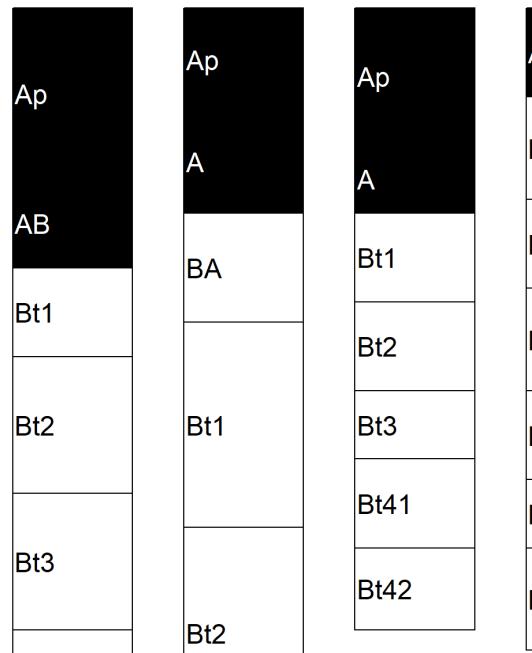

The Mollie Epipedon

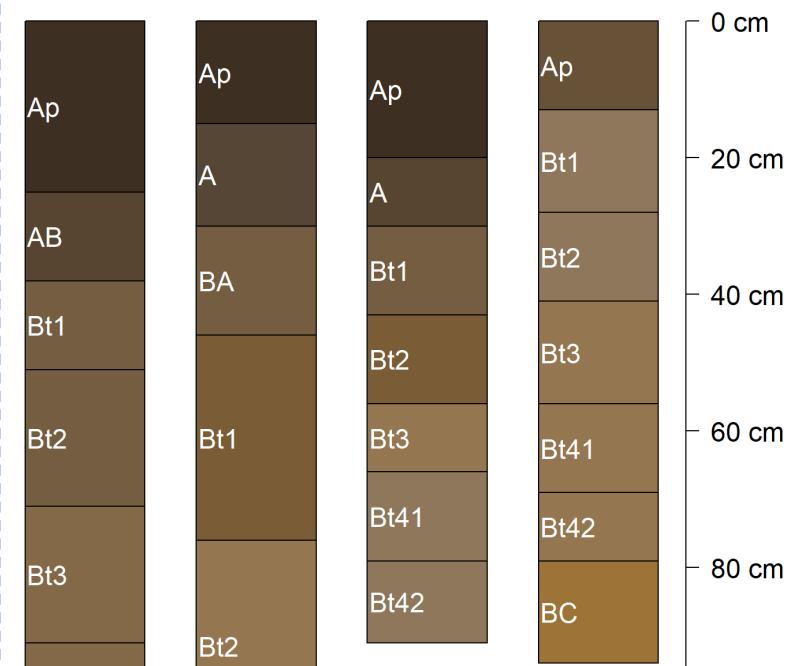

Tama - Fine-silty, mixed, superactive, mesic Typic Argiudolls

Official Series Description: https://soilseries.sc.egov.usda.gov/OSD_Docs/T/TAMA.html

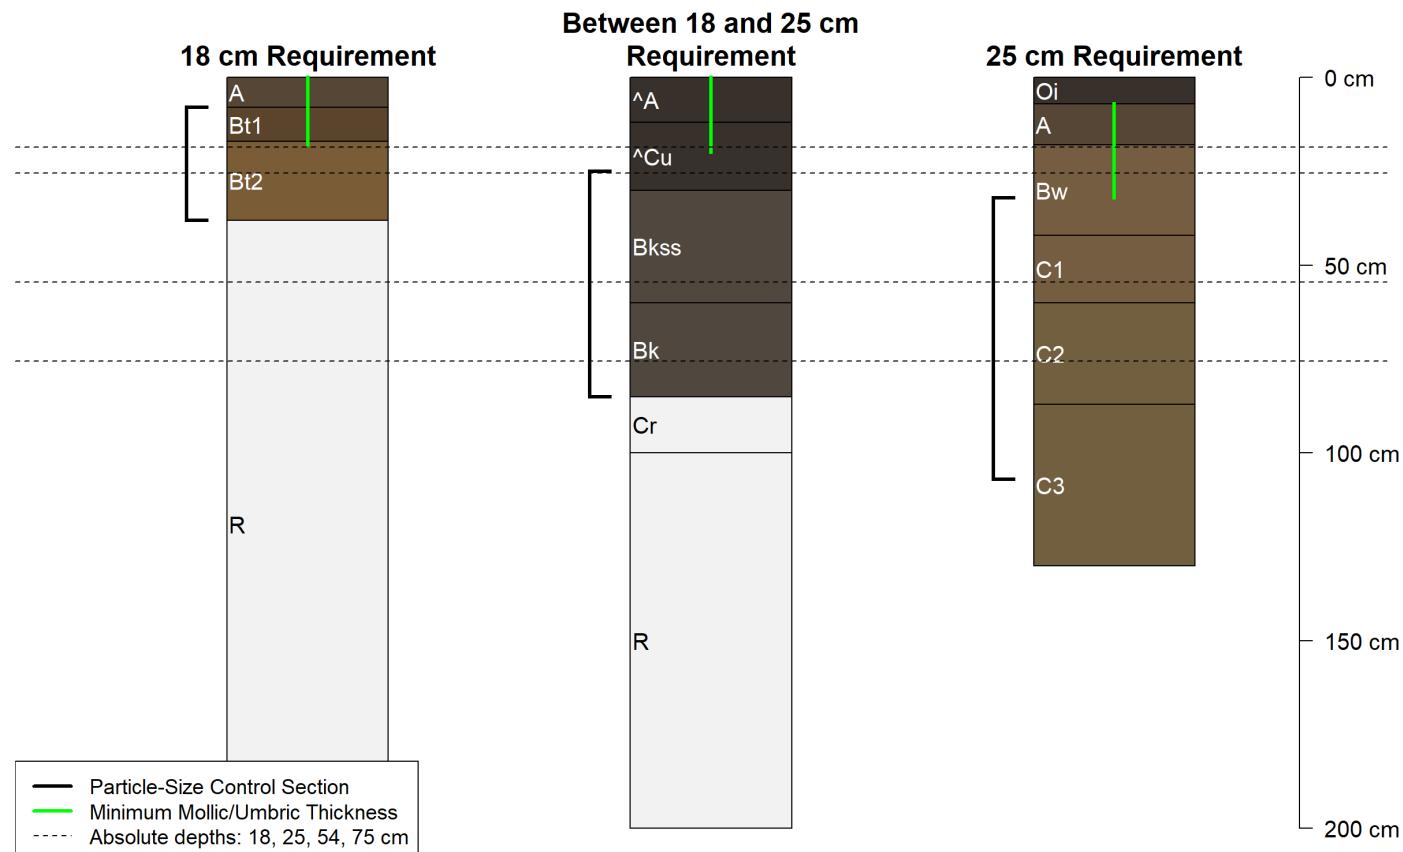

is_mollie_color

moist_color

The Mollie Epipedon

The Mollie Epipedon

Problems

- Physical mixing criteria are confusing, impossible to apply retroactively, and subjective when materials are very dissimilar in composition or density.

The Mollie Epipedon

Problems

- Physical mixing criteria are confusing, impossible to apply retroactively, and subjective when materials are very dissimilar in composition or density.
- The sliding scale thickness requirement is commonly misinterpreted and may be difficult to apply consistently.

The Mollie Epipedon

Problems

- Physical mixing criteria are confusing, impossible to apply retroactively, and subjective when materials are very dissimilar in composition or density.
- The sliding scale thickness requirement is commonly misinterpreted and may be difficult to apply consistently.
 - Simultaneous dependency on: texture class of subhorizons, distribution of organic carbon with depth, identifiable secondary carbonates, petrocalcic/duripan/fragipan, densic/lithic/paralithic contacts, and argillic, cambic, natric, oxic, or spodic horizons. Not only does it depend on presence or absence, but required thickness is determined by *depths to top or bottom* of these features.

The Mollie Epipedon

Problems

- Physical mixing criteria are confusing, impossible to apply retroactively, and subjective when materials are very dissimilar in composition or density.
- The sliding scale thickness requirement is commonly misinterpreted and may be difficult to apply consistently.
 - Simultaneous dependency on: texture class of subhorizons, distribution of organic carbon with depth, identifiable secondary carbonates, petrocalcic/duripan/fragipan, densic/lithic/paralithic contacts, and argillic, cambic, natric, oxic, or spodic horizons. Not only does it depend on presence or absence, but required thickness is determined by *depths to top or bottom* of these features.
- Several exceptions: keeping depositional phases in the Mollisols, aridic soil moisture regimes, and unique color and organic carbon requirements in materials with a high content of carbonate

Soil Series

- The soil series is the lowest, most detailed taxonomic level in U.S. Soil Taxonomy.

Soil Series

- The soil series is the lowest, most detailed taxonomic level in U.S. Soil Taxonomy.
- Nominally, a soil series has a *single* family-level classification. This is in the *Official Series Description* (OSD).

Soil Series

- The soil series is the lowest, most detailed taxonomic level in U.S. Soil Taxonomy.
- Nominally, a soil series has a *single* family-level classification. This is in the *Official Series Description* (OSD).
- The *Range in Characteristics* (RIC) should **not** range outside the series family.

Soil Series (Fayette RIC)

Fayette - Fine-silty, mixed, superactive, mesic Typic Hapludalfs

Official Series Description: https://soilseries.sc.egov.usda.gov/OSD_Docs/F/FAYETTE.html

RANGE IN CHARACTERISTICS:

Depth to carbonates--greater than 100 centimeters

Content of clay in the particle-size control section (weighted average)--24 to 32 percent

Content of sand in the particle-size control section (weighted average)--less than 5 percent

Coarse silt to fine silt ratio in the particle-size control section--0.9 to 1.5

A horizon:

Hue--10YR

Value--2 or 3

Chroma--1 or 2

Texture--silt loam

Clay content--15 to 27 percent

Reaction--very strongly acid to neutral

Ap horizon (if present):

Hue--10YR

Value--4

Chroma--2 or 3

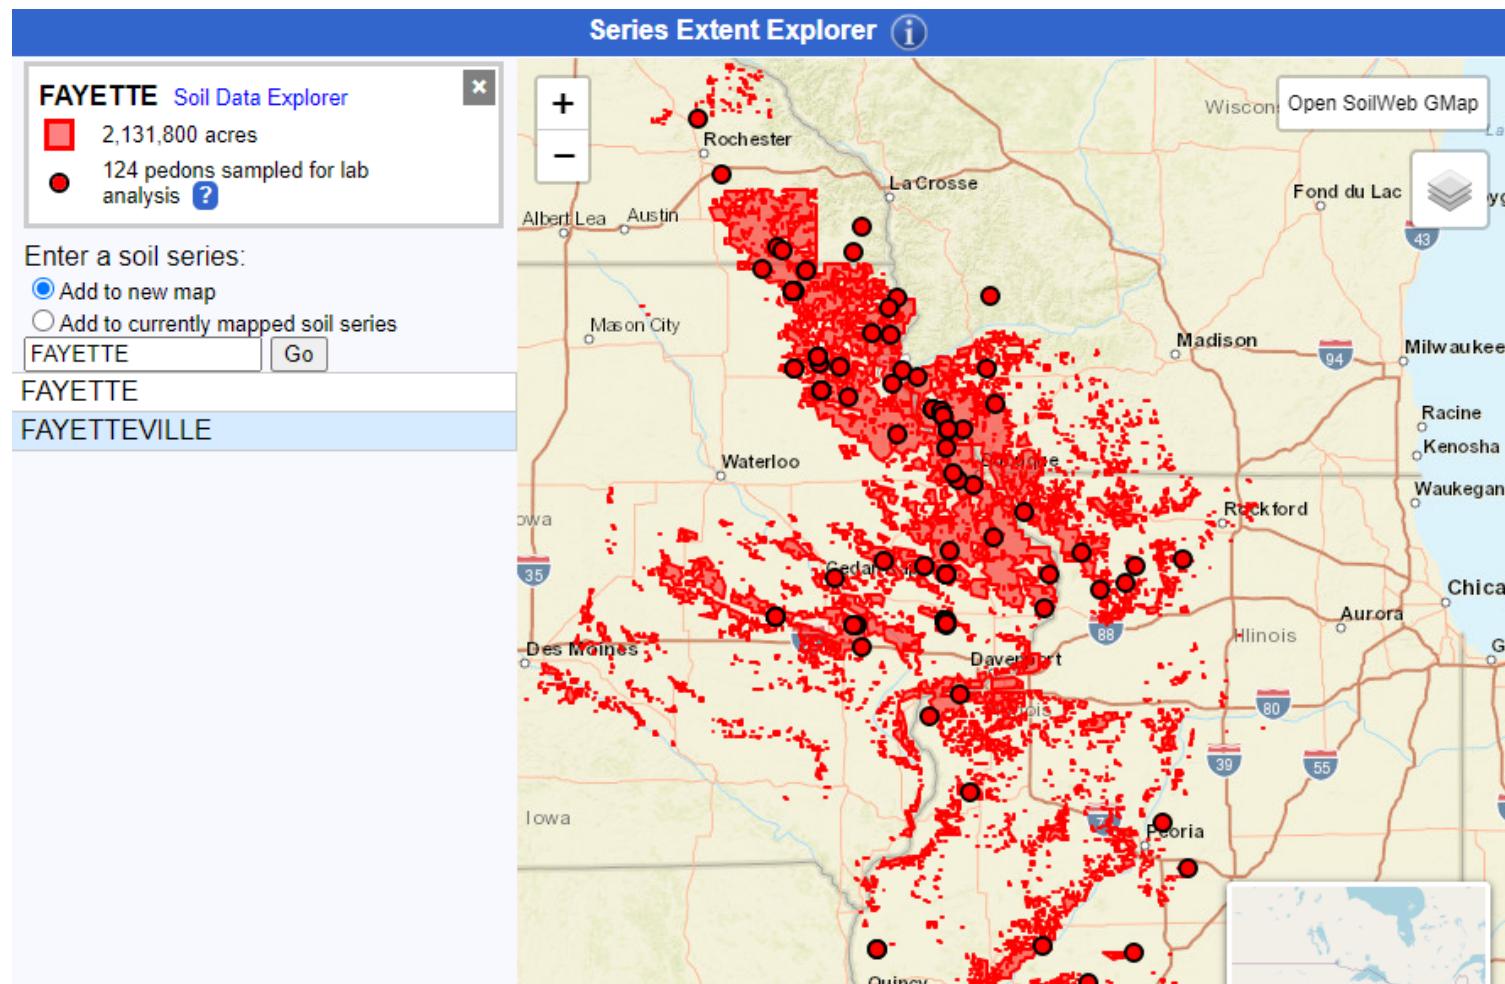

Texture--silt loam

Clay content--15 to 27 percent

Reaction--very strongly acid to neutral

Soil Series (Fayette Extent)

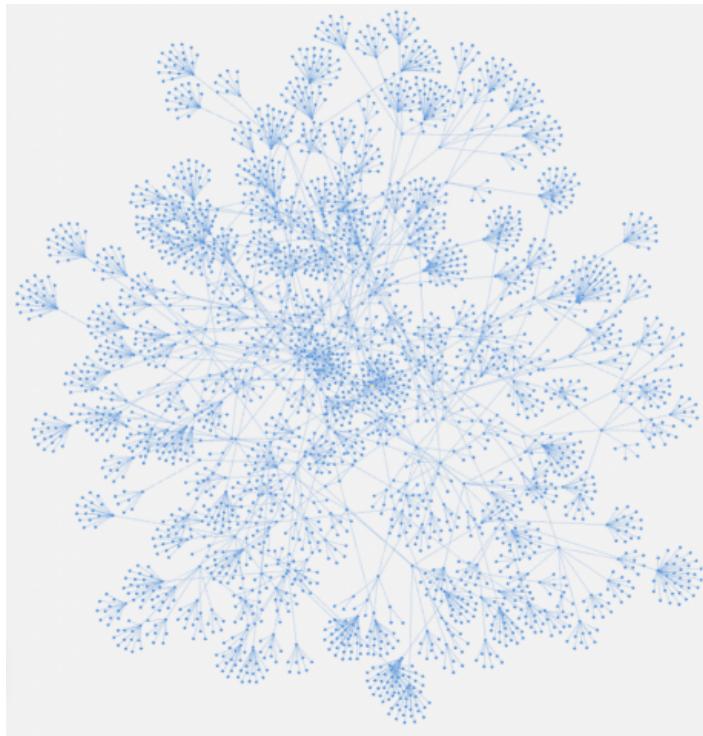

Soil Series in Soil Mapping

- Soil map unit component ranges need not exactly match those of the series RIC; often they are wider.
- In practice, especially in less-detailed (Order 3+) mapping, series-level components in the U.S. include:
 - Soils *within* the RIC of the series
 - Soils *outside* the RIC that *have same family* as the named series (generally: "similar soils," formerly: "variant")
 - Soils *not* in the same family (taxadjuncts or less-prevalent series) that *interpret* the "same" based on local model
- *Dissimilar* soils are separated based on interpretive difference(s) from the dominant condition in a map unit.
 - Dissimilar, *non-limiting* soils may not be reflected consistently in more general mapping if they are not extensive.

Future of Soil Taxonomy

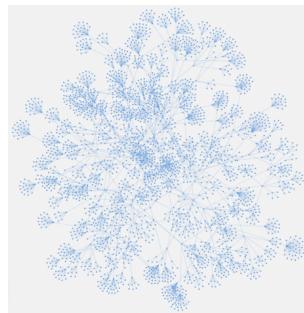

All 3082 subgroup to order level taxa in U.S. Soil Taxonomy, "rooted" to a common node.

To reconcile the "divisive" nature of the Keys and questions of "similarity" — *what do we need?*

- Graph databases capable of querying complex relationships between taxa, criteria, and metadata
- A U.S. Soil Taxonomy ontology to define our terms and serve as a scaffold for other National Cooperative Soil Survey Standards

Future of Soil Taxonomy

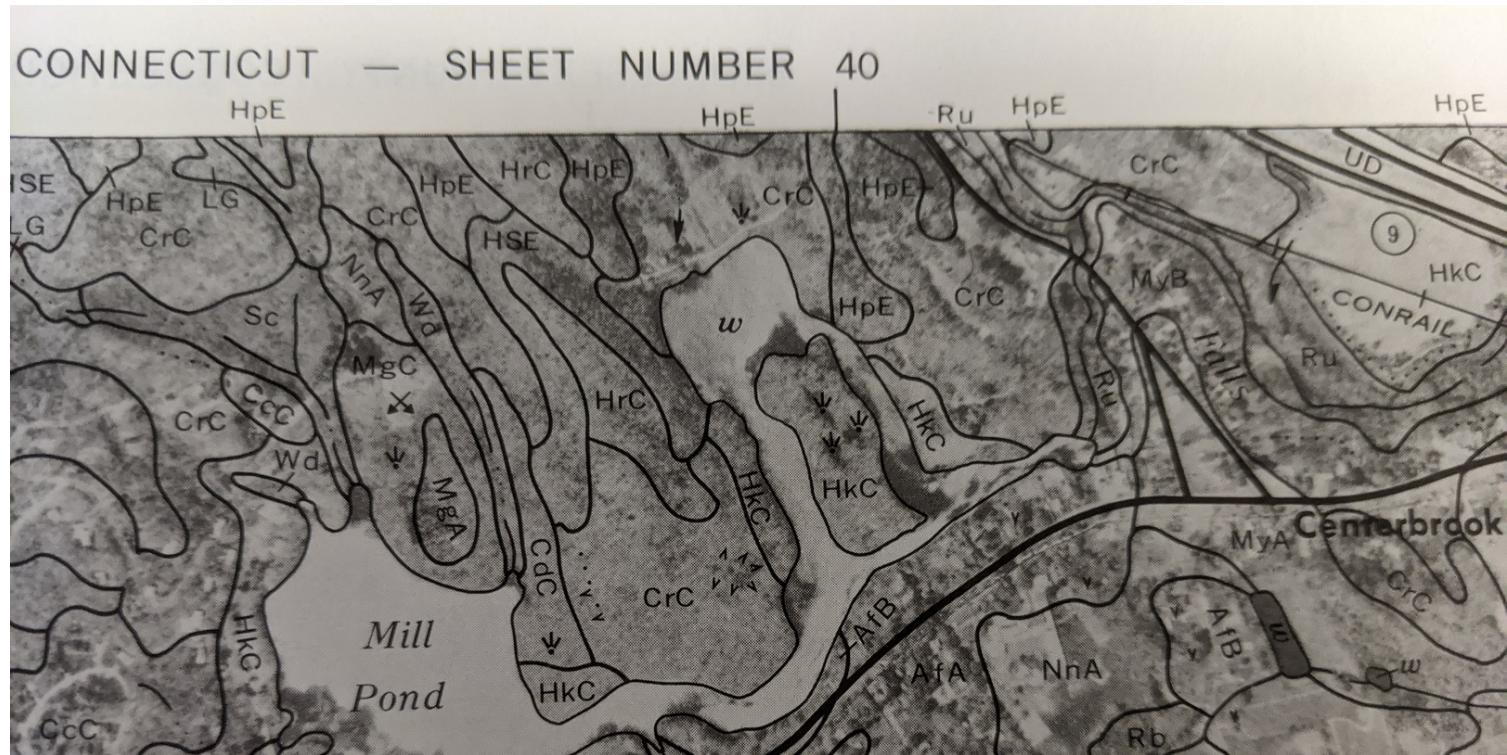

Goals and dreams

1. "Fuzzy taxon membership" developed using *defined* weights, assumptions, and heuristics
2. Sensitivity analysis using properties *and* geometry for "most likely" profile taxonomic placement
3. Regional/purposive subsets or "views" of the complete taxonomy: to aid in education, reduce fatigue, and increase accessibility for non-specialists
4. Justification (and possible simplification) of concepts
5. Quantification of impacts and a unit-testing suite for proposed revisions

Impacts on Soil Mapping

- All soils are "different" – defined rules and systems allow us to "consistently" reason over them.
- *Taxadjunct* is **not** a dirty word. Embrace the variations nature has to offer.
